

Using UReply to assess Peer Instruction in a flipped classroom environment

Dr Lexie Sanderson

A
Lecturer's challenge
To change students' learning attitudes, classroom culture, to increase meeting and audience participation

Discussion
Present to the student and discuss the lecture and address their questions. Encourage them to ask questions.

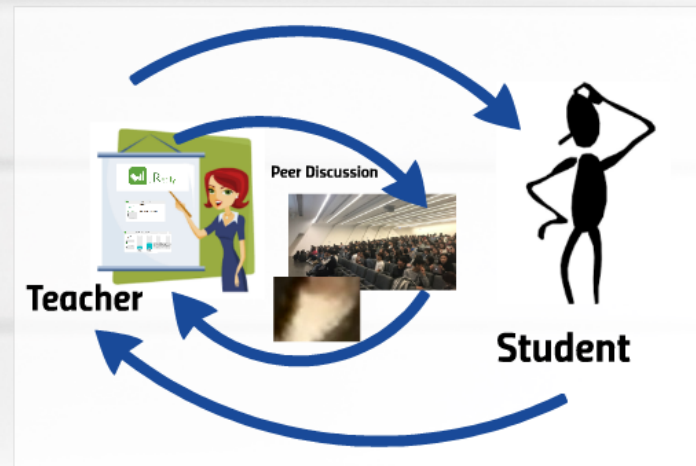

Peer Instruction (PI)
A pedagogical approach which involves the learner presenting a problem to themselves or the learner. (Baker, 1997)

Method
Peer Instruction (PI) is a flipped classroom approach.

Aim of PI
The aim of peer instruction is to encourage students to work together to solve problems and to learn from each other.

Aim
Using the flipped classroom system to improve student learning outcomes in a flipped classroom.

Using UReply to assess Peer Instruction in a flipped classroom environment

Dr Lexie Sanderson

Aim of PI

Support students in developing a deeper understanding of the material by using peer instruction to solve problems.

Aim

Using the student response system we designed we will assess the retention of information.

A

Lecturer's challenge

to encourage students to engage actively in classroom activities to improve learning and academic performance

Incorporating technology

engaging students through the use of student response systems increases student engagement and participation (Jones, Antonenkot & Greenwood, 2012).

Peer Instruction (PI)

a pedagogy approach which makes the learner more central to what is happening in the lecture theater. Developed by the Harvard Physicist (Mazur, 1997)

Aim of PI

aims to support students in developing a deeper understanding of lecture material, leading to extrapolation of knowledge to address problem solving in the real world.

Principle

lectures are interspersed with conceptual MCQ designed to expose common difficulties in understanding difficult lecture material.

Principle

lectures are interspersed with conceptual MCQ designed to expose common difficulties in understanding difficult lecture material.

Literature

- Initially focused on physics where research has demonstrated that PI vastly improves student performance (Crouch & Mazur, 2001; Gok, 2015).
- Research on PI methodology has predominantly focused on STEM subjects (science, technology, engineering and mathematics).
- In a survey of over 300 institutions using PI to teach: physics, chemistry, life sciences, engineering and astronomy, over 80% consider PI to be successful; suggesting that, using PI does successfully enhance learning (Fagan, Crouch & Mazur, 2002).
- PI has also been found to positively impact student confidence during a modified form of PI in two chemical thermodynamics classes (Brooks & Koretsky, 2011).
- PI has been found to be a positive solution for maintaining student satisfaction in large computer science classes (liao et al., 2017).

Aim

Using the student response system UReply we assessed whether PI can facilitate retention of information in large, flipped social science lecture.

Method

- Students - 326 (own and peer)
- Flipped Social Science lecture - cognition and learning
- Week 7 of 13 week course

- Students were posed a high level intellectual question.
- Students were given individual thinking time to answer the question.
- Students were not shown the histogram of responses.
- Students were told when 80% of the class had responded.
- Students responded to the UReply question using a mobile phone device as a clicker.
- After the students had responded to the first question they were asked to engage in peer discussions regarding the same question.
- Peer discussion continued until 80% of students answered.

Question: 1

By using algorithm to solve a problem, we:

- a) sometimes arrive at one correct solution
- b) sometimes arrive at more than one correct solutions
- c) always arrive at one or more correct solution(s)
- d) never arrive at more than one correct solutions

own

Correct Answer

peer

Correct Answer

A McNemar's test with continuity correction determined that the difference in the proportion of correct answers between pre-lecture knowledge and after peer discussion was statistically significantly different, $\chi^2(1) = 57.188, p = .00$.

Discussion

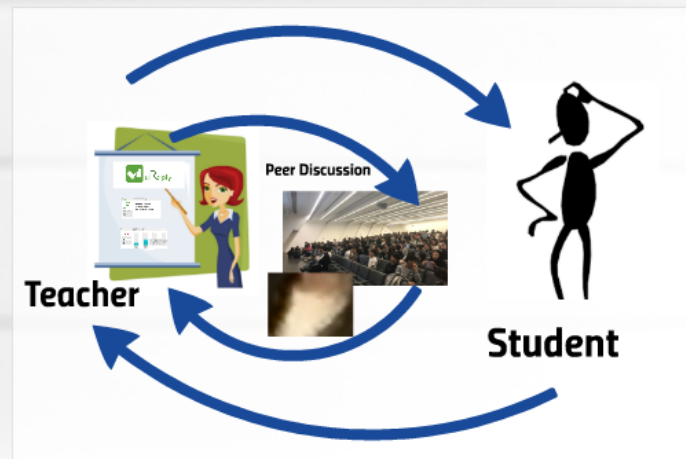

UReply is a useful and efficient tool for lecturers and students to use when assessing knowledge gain in large lectures.

Social reinforcement from peers and a co-operative learning environment facilitates learning and retention in large, flipped social science lectures.

Conclusion

- PI may go beyond communication of information
- Lead to gaining a deeper understanding through active knowledge transfer
 - UReply is an efficient tool for assessing PI

Using UReply to assess Peer Instruction in a flipped classroom environment

Dr Lexie Sanderson

Aim of PI

To support students in developing a deep understanding of the concepts and skills required to solve complex problems in the real world.

Aim

Use the student response system UReply to assess whether PI can be used in social science.
